

1. Which keyword is used to define a function in Python?

- A. function
- B. define
- C. def
- D. fun

2. What is the correct syntax to call a function named `display`?

- A. call display()
- B. display()
- C. display.call()
- D. function(display)

3. A function that returns no value automatically returns:

- A. 0
- B. False
- C. None
- D. Null

4. Which statement is used to return a value from a function?

- A. break
- B. continue
- C. pass
- D. return

5. Which of the following is a built-in function in Python?

- A. print()
- B. display()
- C. show()
- D. output()

6. A function defined inside another function is called:

- A. Nested function
- B. Recursive function
- C. Lambda function
- D. Anonymous function

7. Functions provided by Python itself are called:

- A. User-defined functions
- B. Built-in functions
- C. Anonymous functions
- D. Recursive functions

8. Functions created by programmers are called:

- A. Built-in functions
- B. User-defined functions
- C. Recursive functions
- D. Lambda functions

9. Which of the following is NOT a built-in function?

- A. len()
- B. type()
- C. input()
- D. calculate()

10. Values passed during function calling are known as:

- A. Parameters
- B. Variables
- C. Arguments
- D. Constants

Variables written in function definition are called:

- A. Actual arguments
- B. Formal arguments
- C. Constants
- D. Keywords

Guess the Output:

```
def show():  
    print("Python")
```

```
show()
```

```
def add(a, b):  
    print(a + b)
```

```
add(4, 6)
```

```
def fun():  
    return 5
```

```
print(fun())
```

```
def display(x):  
    return x * 2
```

```
print(display(3))
```

```
def test(a, b=5):  
    print(a + b)
```

```
test(10)
```

```
def test(b=5,a):  
    print(a + b)
```

```
test(10, 2)
```

```
def value(x, y):  
    return x - y
```

```
print(value(y=4, x=10))
```

```
def total(*num):  
    print(len(num))
```

```
total(1, 2, 3, 4)
```

```
def show(**data):  
    print(data)
```

```
show(name="Ram", age=20)
```

```
square = lambda x: x * x  
print(square(5))
```

```
x = lambda a, b: a + b  
print(x(2, 3))
```

```
def func(a):  
    a = a + 5  
    print(a)
```

```
x = 10  
func(x)  
print(x)
```

```
def demo():  
    print("A")  
    return  
    print("B")
```

```
demo()
```

```
def calc(x):  
    return x + 2
```

```
print(calc(calc(3)))
```

Which argument type passes values according to their position?

- A. Keyword argument
- B. Default argument
- C. Positional argument
- D. Variable-length argument

In keyword arguments, arguments are identified by:

- A. Position
- B. Name
- C. Datatype
- D. Index

Which argument allows a function to take unlimited positional arguments?

- A. *args
- B. **kwargs
- C. default
- D. lambda

Which argument allows unlimited keyword arguments?

- A. *args
- B. **kwargs
- C. lambda
- D. return

Default arguments are assigned:

- A. During function call
- B. During function definition
- C. During execution
- D. During compilation

Which argument type is used when the number of arguments is unknown?

- A. Positional
- B. Keyword

- C. Variable-length
- D. Default

Which symbol is used for keyword variable-length arguments?

- A. *
- B. **
- C. #
- D. @

Lambda functions are also known as:

- A. Recursive functions
- B. Nested functions
- C. Anonymous functions
- D. Built-in functions

Which keyword is used to create a lambda function?

- A. lam
- B. lambda
- C. func
- D. anonymous

A lambda function can contain:

- A. Multiple statements
- B. One expression only
- C. Loops only
- D. Class definitions

Which of the following is TRUE about lambda functions?

- A. They always need a return statement
- B. They can contain multiple expressions
- C. They are anonymous functions
- D. They cannot take arguments

Lambda functions are generally used for:

- A. Long programs
- B. Small temporary tasks
- C. Database connection
- D. File creation

Which of the following creates a lambda function?

- A. `lambda x: x+1`
- B. `def x():`
- C. `function x()`
- D. `create x`

A recursive function is a function that:

- A. Calls another function
- B. Calls itself
- C. Returns multiple values
- D. Uses lambda

Which condition is necessary in recursion to stop infinite calling?

- A. Loop
- B. Continue statement
- C. Base condition
- D. Lambda expression

Recursion mainly solves problems by:

- A. Iteration only
- B. Breaking into smaller subproblems
- C. Using classes
- D. Avoiding functions

What may happen if a recursive function has no base condition?

- A. Syntax error
- B. Program ends normally
- C. Infinite recursion error
- D. Function becomes lambda

Which data structure mainly uses recursion internally?

- A. Queue
- B. Stack

C. Array
D. Tuple
